Deep Learning

What are W&B Experiments & Runs?

Basic Unit

A Run is the basic unit of computation logged

Model Outputs

Predictions, media, plots, datasets, model files

Track Everything

Hyperparameters, code versions, metrics, system usage

Central Goal

Centralize, visualize, compare, and share ML work

Creating & Configuring an Experiment

Framework Integrations

W&B supports 30+ libraries including PyTorch, TensorFlow, Hugging Face, and scikit-learn with minimal code changes.

Platform Compatibility

Works seamlessly with cloud services like AWS SageMaker, Databricks, and Azure, plus local environments.

Custom Integration

Add W&B to any library using our simple SDK or leverage our API hooks for specialized tracking needs.

Setting up W&B experiments is straightforward regardless of your ML stack. Initialize with **wandb.init()**, configure key parameters, and integrate with your favorite frameworks through dedicated callbacks.

Creating & Configuring an Experiment (II)

Initialize

```
run = wandb.init(project="...", entity="...", config={...})
```

Access Config

```
run.config.learning_rate
```

Log Metrics

```
run.log({"loss": loss_value})
```

Finish

Automatic with context manager or `run.finish()`

Logging Data: Metrics, Media & More

Metrics

Scalars changing over time (loss, accuracy)

Media

Images, video, audio, HTML, point clouds

Plots

Custom charts via wandb.Plotly(), etc.

Summary

Track final values with `run.summary`

Viewing Results: Projects & Workspaces

Project

Container for related runs

Access via wandb.ai/entity/project-name

Workspace

Primary analysis dashboard

Runs sidebar, visualization panels
